SilverStone — The Material Science

WHAT IS SILVERSTONE (VERBATIM)

SilverStone is our patented wellness stone. We take porcelain clay, heat it to 1,300°C, and infuse it with silver and copper nano-particles. This makes it anti-bacterial, anti-fungal, non-porous, stain-proof, scratch-resistant, and impact-resistant. It is 100% food-grade — you can eat directly off it. It is stronger than granite and more elegant than marble. And because it is engineered, not mined, it does not harm the environment.

Key phrase to remember: "It looks like a stone, but it does not behave like a regular stone." Every part of the kitchen is stone — shutters, cabinets, shelves, and the carcass. 0% wood.

The 7 Safety Pillars — always in this order

Pillar | What it means

1. Stain Safe — Non-porous. Coffee, haldi, oil wipe off easily.
2. Scratch Safe — Daily chopping won't leave marks.
3. High Load Bearing — Drawers support up to 60 kg each.
4. Fire Safe — Stone does not catch fire or spread flames.
5. Water Safe — 30-day water test: wood swelled, stone unchanged.
6. Impact Safe — Heavy ceramic jar drop test: stone stayed intact. Stronger than granite.
7. More Storage — Up to 62% more storage than standard kitchens. Fits large Indian plates.

Material comparisons

vs | The answer

Granite — Granite is porous — absorbs stains and bacteria, needs periodic polishing, quality varies. SilverStone is non-porous, antibacterial, uniform, stronger than granite.

Marble — Natural stones come from mining (environmental damage), are porous and high-maintenance. SilverStone is engineered: toxin-free, non-porous, zero maintenance.

Tiles — Tiles have grout lines that trap dirt, grease, and fungus. SilverStone has no grout lines — mould and fungus cannot grow on it.

Wood / branded modular — Compressed wood (< Rs. 100/sq.ft. material) contains formaldehyde, attracts termites, absorbs moisture. SilverStone (~Rs. 500/sq.ft. material) is antibacterial, termite-proof, maintenance-free — at a similar finished price.

Technical FAQ facts to know cold

- Weight: stone is denser than compressed wood; the cabinet structure is engineered to balance the load — no impact on flooring; patented hardware keeps operations smooth.
- Brittleness: stronger than granite; heavy-utensil and ceramic-jar drop tested — impact-safe.
- Warping: dimensionally stable — does not bend, warp, or sag with moisture, heat, or time.
- Waterproof: 30-day submersion test — wood swelled, stone unchanged. (In-built lights are NOT waterproof; they are positioned away from water exposure.)
- Food-grade: silver + copper infusion prevents bacteria — you can eat directly off the surface.
- Hardware: patented, made in the same European facilities as Blum and Grass; 100+ kg load capacity; rust-resistant with a 10-year warranty.
- Maintenance: no buffing or polishing ever — a damp cloth is enough.

VIDEO NOTE (COLOSSYAN)

The 7 Safety Pillars table and the granite/tiles/wood comparisons are the natural comparison-graphic

segments for this module's video.

PART 2 · VIDEO NARRATION SCRIPT (ENGLISH)

The narration for this module's video — the same voiceover you hear on the module page.

It looks like a stone. But it does not behave like a regular stone. This is SilverStone.

SilverStone is our patented wellness stone. We take porcelain clay, heat it to thirteen hundred degrees Celsius, and infuse it with silver and copper nano-particles. That makes it anti-bacterial, anti-fungal, non-porous, stain-proof, scratch-resistant, and impact-resistant. It's one hundred percent food-grade — you can eat directly off it. Stronger than granite. More elegant than marble. Engineered, not mined.

Present the seven safety pillars in this order, every time: stain safe; scratch safe; high load bearing — drawers hold up to sixty kilos each; fire safe; water safe — in a thirty-day water test, wood swelled while the stone stayed unchanged; impact safe — a heavy ceramic jar dropped on it left it intact; and more storage — up to sixty-two percent more than standard kitchens.

Granite is porous — it absorbs stains and bacteria and needs polishing. Marble comes from mining and needs constant care. Tiles trap dirt and fungus in their grout lines. SilverStone is non-porous, antibacterial, uniform — with no grout lines at all.

And the big one — compressed wood: under one hundred rupees a square foot of material, bringing formaldehyde, termites, and moisture damage. SilverStone material is around five hundred rupees a square foot — antibacterial, termite-proof, maintenance-free — at a similar finished kitchen price.
