

MAGPPIE L&D · SALES ACADEMY

The Magppie Brand Story

The Material Science narrative (canonical founder narrative)

Verbatim from the Notion "Magppie Brand" page, received 2026-07-15. Carries the [CONFIRM YEAR], [VERIFY: Red Dot] and KBIS award-name flags — see Modules 1 and 3.

Source: Notion "Magppie Brand" (canonical founder narrative), pasted verbatim by the team on 2026-07-15. This is the Notion side of the [CONFIRM YEAR] conflict (it says the first stone kitchen was 2018; the AI Bot Master Training Document says late 2016) and it asserts the Red Dot award ([VERIFY: Red Dot]) and the KBIS award name "World's Most Innovative Kitchen Brand" (the AI Bot doc's correction says "Most Unexpected Innovation" supersedes that phrasing). None of these conflicts are resolved here.

Part One — The concept of Material Science

Nature Never Make Mistakes.

Every material in nature is scientific, each one carries a unique composition, unique properties, unique capabilities and a unique purpose that make it ideal for specific applications. Every material is not suitable for every application.

For example,

1. Copper carries electricity, steel does not.
2. But steel carries structural strength.
3. Mirror can reflect our image, glass cannot.
4. But glass carries transparency.
5. Wood can lit fire, stone cannot lit fire.
6. Stone withstands heat, water, pressure and time.

Every material is born with its own properties. And for thousands of years, humanity has advanced by understanding one simple principle:

The right material in the right place creates the best performance.

When we choose the wrong material in any application, sooner it later, it will show its worst effects.

For example:

1. A car cannot be made from wood.
2. A bridge cannot be built from paper.
3. An electrical system cannot run efficiently on cotton threads.

Every engineer understands this principle. That is why electrical systems around the world use copper.

Copper carries extraordinary conductivity, allowing electricity to travel efficiently and safely through homes, buildings, smartphones, computers, hospitals, and factories.

Imagine replacing copper with iron. No electricity can be generated.

Replace it with wood. The system would not work at all.

Nature has already chosen the correct materials for all applications.

Our responsibility is simply to understand it and respect it.

Part Two — Why we ignored this Material Science inside our homes?

Surprisingly, while engineering has become highly sophisticated in automobiles, aircraft, electronics and medicine, the same scientific thinking has mostly been absent inside our homes, which happens to be the living space for our families.

Particularly in the most important room of all:

The Kitchen.

The kitchen is not furniture. The kitchen is a food preparation laboratory.

It is exposed daily to: fire, steam, water, oil, heat, acids, heavy usage, food contamination risks.

In many homes, the kitchen operates for 10 to 14 hours every day, preparing three meals of the day.

The health of an entire family begins here.

Yet the material most commonly used worldwide for kitchen cabinets is compressed wood boards, particle boards, MDF, HDF, HDHMR boards, and plywood.

These materials are originally created from wood fibers, wood waste, glue, chemicals and resins.

This raises an important question:

Would an engineer designing a space exposed to water, heat, fire, moisture, and food choose compressed wood as the ideal material?

The answer is obvious.

Part Three — Why such a contradiction then?

Wood was nature's fuel.

For centuries, humans burned wood to create fire. Yet today we place wood directly around cooking zones. Kitchen is the only place in our home, where there is fire.

The very material traditionally used to create the fire is now being used to surround the fire.

All Compressed Wood boards absorb moisture.

They swell. They deteriorate. They attract fungus. They can harbor bacteria.

Most ply boards, MDF, HDF, HDHMR, particle boards, contain chemical binders that releases volatile organic compounds (VOCs) over time. That too, in the very place where families prepare food.

This is not material science. This is material compromise.

What History Already Knew

Less than a century ago, kitchens across many parts of the world were built primarily from stone and its allied materials.

Stone was trusted because it was naturally: water resistant, fire resistant, highly durable, hygienic, long lasting.

Stone survives generations. Look at our historical temple and buildings like Taj Mahal — all built in stones.

Stone was always the material nature intended for demanding environments like kitchen where water, heat, fire and fumes work together.

The challenge was never the performance of Stone. The challenge was manufacturing technical capabilities and commercial viability. Stone has always been 5-7 times more expensive than compressed wood, and moreover stone was difficult to engineer, difficult to fabricate, difficult to assemble, and difficult to commercialise at scale.

So as we entered the age of industrialisation, the factories adopted easier and cheaper materials, like compressed wood. Not necessarily better materials. Simply easier and cheaper materials.

Part Four — World's First Stone Kitchen was borne in 2018

In 2007, Magppie founder, Mr Vinod Jain asked one simple question:

If stone is naturally the superior material for kitchens, why can't we engineer stone to build a Kitchen, where everything is built in Stone — be it cabinets or door facias or countertop — Everything Stone,

and Zero Wood?

That question started an 11-year research journey.

A journey that led to the creation of the world's first Stone-Built Kitchen. And that happened in 2018, when Magppie's and the World's first stone kitchen was borne and got installed in an Indian Home in New Delhi.

Part Five — World's First Wellness Kitchen was borne in 2021

In 2020, during Covid, we realised the power of virus and bacteria. Not just one family but one planet came to a grinding halt — just by one invisible virus.

In that year, Mr Vinod Jain asked another question:

Is there a way to make a stone with zero bacteria, zero virus and zero VOCs?

During Covid only, he met with some nano technology scientists in India, who confirmed that inside the stone, they can infuse the power of nature's most respected wellness elements:

Silver and Copper. With the help of advanced nano technologies.

Silver has been trusted for centuries for hygiene and anti microbial properties.

Copper has been valued across civilizations for vitality, energy and wellness.

Even today, Vastu consultants, Ayurvedic practitioners, and wellness experts recognize copper as one of the most beneficial material within living spaces.

By combining these natural elements with advanced engineering, Magppie created a totally new material for this world called as SILVERSTONE that is:

- Bacteria Safe
- Fungal Safe
- Virus Safe
- Cancer Safe
- Asthama Safe
- Termite proof
- Zero Formaldehyde
- Clean Air Quality
- Fireproof, Non Combustible
- Waterproof, Zero water absorption
- Fully washable with water
- Fully hygienic
- Scratch proof surface
- Stain proof, including Turmeric
- More durable than Granite
- Permanent non fading finishes
- Designed for good health of the family
- With Outdoor kitchen capability

A material which is an engineering marvel and Magppie acquired global patents on this material in 2021.

Part Six — World's First Wellness Wardrobe was borne in 2023

The Same Truth Applies To Wardrobes.

The wardrobe is where we store our clothes that is in touch with our skin every day.

Our clothes sometimes remain inside wardrobes for weeks and months.

Yet conventional wardrobes are often built using cheapest particle board or MDF material, containing synthetic chemicals and cancer-causing adhesives.

When our clothes are stored for long time in these wardrobes, they absorb these chemicals. And these clothes touch our skin.

The skin is the largest organ of the human body.

Again, the question becomes:

Are compressed wood boards truly the right materials for wardrobe application?

Magppie believes the answer is no.

That is why in 2023, we created World's First wellness wardrobes built entirely in stone.

More Beautiful. More Durable. More Hygienic. Zero Chemicals. Engineered for long-term well-being.

Part Seven — A Global Industry Blind Spot

For decades, the global kitchen industry focused on aesthetics.

Colors. Finishes. Styles. Accessories.

Yet very few asked the fundamental questions of material science:

"What is the best material for human health and lifelong performance?"

One Indian company dared to ask that question. One Indian company spent eleven years solving it.

One Indian company created a completely new category:

The Wellness Interiors Systems.

And that now includes:

1. Wellness Kitchen
2. Wellness Wardrobes
3. Wellness Bath Vanities
4. Wellness Surfaces for walls & floors

Part Eight — Global Recognition

And in 2026, the world began to notice this invention.

In 2026, at the prestigious Kitchen & Bath Industry Show (KBIS), one of the world's largest kitchen industry events, Magppie was recognized as World's Most Innovative Kitchen Brand for its breakthrough innovation among leading global brands.

The same year, Magppie received Red Dot international design Award for creating a new approach that supports both human health and planetary sustainability.

Part Nine — The Future of Homes

The future of homes will not be defined by decoration. It will be defined by material intelligence.

Just as copper transformed electrical systems.

Just as steel transformed construction.

Just as silicon transformed computing.

Silverstone, by Magppie which is reimagined through wellness science and ancient Indian wisdom, will transform the spaces where we cook, live and thrive.

Because wellness does not begin in a medicine cabinet. It begins with the materials that surround us every day.

Magppie did not set out to build another kitchen.

Magppie set out to correct one of the greatest material mistakes in modern homes.

And in doing so, created the world's first Wellness Kitchen. And Wellness Wardrobes.

Now the question is:

"If nature created every material with a purpose, why are we using the wrong materials in the most important spaces of our homes where our family breathes for years?"

Magppie is simply bringing back the "Truth":

Nature already chose the right materials.

Magppie simply rediscovered them and engineered them further for modern life.
